EuroSDS® provides complete process documentation right from the start. The basic package includes packing, sterilisation and release of sterile goods, as well as process data archival, protocols and statistics. **Build up to a full-scale tracking & tracing system** by incorporating additional modules **at any time**: cleaning & disinfection, delivery and return, order entry, instrument and repair management.

As the third generation of process documentation systems developed by IBH, the functionality of **EuroSDS®** is backed by hundreds of installations in the European market and incorporates **more than 10 years of expertise in process documentation, software development, project management and customer support.**

EuroSDS® can easily be configured to suit your organisational structure and work-flow demands.

EuroSDS® also enables you to track & trace the textile supplies for operating theatres and wards.

A light-weight and robust data interface allows **EuroSDS®** to process data of virtually any steriliser or washer-disinfector.

EuroSDS® components adhere to software industry standards and can exchange data with most third-party applications and medical information systems.

EuroSDS® software is always on the cusp of technology, which ensures the quality of your investment for today and tomorrow.

EuroSDS® combines modern software technology with an intuitive, easy-to-learn graphical user interface for fast and seamless integration into your daily routine.
